

Abstract:

Electromagnetic Valve

The invention relates to an electromagnetic valve with a valve-accommodating member (3) into which a section of a first tubular body (1) remote from a second tubular body (2) is inserted in a pressure-fluid tight manner, with the section of the second tubular body (2) facing the first tubular body (1) being secured to the valve-accommodating member (3) and the section of the first tubular body (1) facing the second tubular body (2) being inserted into the second tubular body (2), and the first tubular body (1) being supported on a stop surface (6) of the second tubular body (2), whereby a simple and tight tubular connection is provided.
